

Intel XDK activity

Open the XDK and start a new project. Use appropriate tags to do include the following:

- Quote some poetry, preserving the "line oriented" format.
- Find a word that has at least 3 different definitions, list them in any order ([this Web site](#) may be helpful)
- Try out some different tags to see the effect they have on your Web page

Please show off what you came up with in the discussion section. You can paste your code directly in a discussion forum post or use one of the following online code editors:

- JS Bin: <http://jsbin.com> (see this tutorial for example:<http://code.tutsplus.com/tutorials/javascript-tools-of-the-trade-jsbin--net-36843>)
- CodePen: <http://codepen.io> (see the video tutorial:<https://css-tricks.com/video-screencasts/112-using-codepen/>)

These are HTML, CSS, and JavaScript code editors that preview/showcase your code bits in your browser. It helps with cross-device testing, realtime remote pair programming.

(or create [Github](#) pages for your work if you know how to use it).
